

Metal Treatment Q&A

How should the product be applied?

The highest area coverage would be achieved by spraying the product. One litre would provide approx. 10 square metres of area coverage. However, it can also be applied by a roller or a brush.

How many layers of coating should be applied?

Normally, one layer of coating should suffice.

How was the product tested?

The product was applied to a metal slab which was put in a salt chamber for a few days. The coated slab had not been effected in the slightest by corrosion and rust. See official tests below.

What tests were carried out to ensure the durability & strength of the coating?

- Determination of water-vapour transmission properties, EN ISO 7783
- Determination of liquid water permeability, EN 1062-3
- Abrasion resistance (Taber), EN ISO 5470-1
- Abrasion resistance, ASTM D4060

How long is the protection of the metal?

Under normal conditions, the protection should last at least 5 years.
